ABSTRACT:

E-government facilitates provision of relevant government information in electronic form to the citizens in a timely manner and better service delivery to citizens. Information Technology today is recognized as an effective tool for turning the economic activity in efficient governance and in developing human resource. E-government is a kind of governmental administration which is based on ICT Services. The essence of e-government is using information technology to break the boundary of administrative organizations, and build up a virtual electronic government. E-government initiatives are common in most countries as they promise a transparent, citizen-centric government and reduce operational cost. Emerging with E-government, theories and practices of public administration have stepped into a new knowledge era. E-government presents a tremendous impetus to move forward with higher quality, cost-effective, government services and a better relationship between citizens and government. This paper discusses the different issues, challenges, adoption factors for e-government implementation, conceptual demarcation on these factors and, presents a conceptual framework for better e-government performance.

KEYWORDS:
e-government, definitions, services, adoption factors, and challenges.

1. INTRODUCTION

ICT is a key element of reform efforts that can help dramatically reshape government to improve performance and reduce costs. The current society had a phenomenal transformation due to the advance of Internet. It has opened a new medium of communication for individuals, business, and government organization, providing more opportunities to communicate and get information in an entirely new way. It has made governmental information and services accessible in ways that could not have been conceived two decades ago [1]. In the past, government organizations paid little attention to service quality or responsiveness to clients, but this changed with the approach of E-Government. E-government refers to the use by state authorities of ICT, in particular, the Internet and web-based technology, to deliver information and services and to encourage civic participation [2]. E-government is simply a facility using Information Technology (IT) to deliver public services directly to the customer, where the customers are citizens, business or other
government entity [3, 4]. This phenomenon of e-government is increasingly attracting the attention of community citizens including politicians, economists, decision and policy makers amongst others. It has improved managerial effectiveness, and promoted democratic values of public services. It has the promise of increasing accessibility to information, enhancing efficiency and facilitation of greater access to government officials [5, 6]. It is the medium of delivering improved services to citizens, businesses, and other constituents of society through drastically changing the way governments manage information. However, the e-Government challenge is not a technological one. Rather, the challenge is to use technologies to improve the capacities of government institutions, while improving the quality of life of citizens by redefining the relationship between citizens and their government [1]. The development of e-government also means increased electronic co-operation within and among public organizations which even puts demands on development that is not technology oriented. The development towards e-government involves social changes of work roles, attitudes and new competence needs [7].

2. E-GOVERNMENT

E-Government initially began as an intra-governmental communication tool. Initially the government organizations developed websites with information, then developed to online transactions - which made the citizens to engage in online participation that connect citizens and decision-makers [8–11]. E-government represents a fundamental change in the whole public sector structure, values, culture and the ways of conducting business by utilizing the potential of ICT as a tool in the government agency [12]. The Internet is indeed the most powerful and popular means of delivering the services to the customers or citizens. Hence, Web sites have been employed as a platform for delivering a wide range of government services electronically. E-government websites help citizens to gain information on government processes and services and hence participating in democratic processes from anywhere at any time. E-Government improves the efficiency and effectiveness all government operations, with citizens, as well as with other organizations.

E-government applications include online payment of tax, bills, filling and submission of applications for several purposes; e-voting etc. E-Government gives citizens more control on interaction with the government; citizens can avail of the governmental services from anywhere and anytime [1]. E-Government is considered as tool for easy administration of governmental activities. Its success depends on its vast usage and management of its infrastructure. Utilization of e-government will provide benefits to the management philosophy of governments. Thus the citizens can collaboratively participate in decision making [13, 14]. Initially E-Government incurs a great cost in building infrastructure but gradually it implementation results in vast savings towards government’s activities. It also increases transparency, and reduce corrupt activities in public service delivery. Table 1 depicts E-Government defined by various related study in the near past.

### 3. E-GOVERNMENT SERVICES

Like any other electronic services, e-government also constitutes various types of services. According to Fang [15] different types of e-government services are categorized in to eight types. 1) Government-to-Citizen (G2C); 2) Citizen-to-Government (C2G); 3) Government-to-Business (G2B); 4) Business -to-Government (B2G); 5) Government-to-Employee (G2E); 6) Government-to-Government (G2G); 7) Government-to-Nonprofit (G2N); 8) Nonprofit-to-Government (N2G). Table 2 gives definition for these of e-government services.

### 4. DISCUSSION : E-GOVERNMENT ADOPTION FACTORS

The adoption factors for e-government services should be thoroughly known before any adoption model is constructed. Many researchers have understood the initiatives that encourage the adoption of e-government services in different environments. These studies have shown that despite different environments having different characteristics, there are general initiatives that promote e-government adoption by ordinary citizens. However, it is worth mentioning that certain situations have unique factors which may either impend or aid the adoption of e-
government services. In order to have a basic understanding of these varying factors, this study reviews the adoption models that have been studied in different locations. The factors that influence the adoption of e-government websites are information quality, system quality and service quality. Information quality is concerned with the measure of the information that the system produces and delivers i.e., characteristics of information produced by e-government Web sites. Quality of information is believed to be the most salient factor for predicting customer decision-making behavior and user intention to use a particular system [30]. The fundamental dimensions of information quality are composed of five dimensions: accuracy, timeliness, relevance, understandability, and completeness [31–33].

System quality refers to the features and performance characteristics of e-government Web sites regarding the quality in use or the citizen’s view of quality. It is an important determinant of user acceptance, user satisfaction and system use. In order for the citizens to continually use the e-government website or for the successfuleness of e-government website system quality should be high. Service quality refers to the quality of personal support services provided to citizens through e-government Web sites, such as answering questions, taking requests, and providing sophisticated solutions to citizen’s problems. It is an important determinant of customer satisfaction and is needed as citizens differ in knowledge, education and experience [30]. Quality
of service is composed of five dimensions: tangibles, empathy, reliability, responsiveness and assurance [34]. Choudrie and Dwivedi [35] found that citizens’ awareness as a factor for the adoption of e-government. Citizens with full time internet access are more likely to be aware of and adopt e-government services. These authors also add that the demographic characteristics of citizens such as the age, gender, education, and social class have an imperative role in explaining the citizen’s awareness and adoption of e-government services. While, Warkentin [36] proposed a e-government adoption conceptual model with citizen trust as the underlying catalyst. The author proposes perceived risk, perceived behavioral control, usefulness, and perceived ease of use. Perceived risk is normally defined as a fear of losing personal information or money, and fear of being spied on the Internet. Warkentin states that Perceived risk is negatively related to adoption. The author posits that the perception that an individual has of control over how personal information will be used, and control over how and when information can be acquired, could encourage adoption. Perceived usefulness on the other hand is simply defined as the utility of the system to the user, and perceived ease of use is termed as a system that is easy to use [36].

Alomari, Woods and Sandhu [37] attempted to identify the main factors that influence citizens’ intention to adopt e-government websites in Jordan, using a theoretical framework consisting of Diffusion of Innovation Theory (DOI) and the Technology Acceptance Model (TAM) and, they found that Trust in government, website design, beliefs, complexity and perceived usefulness were significant factors in Jordanian citizens’ intention to use e-government websites. Deltor and Hupfer [38] identified internal factors within government that affect the adoption and use of government websites and suggest that Partner cooperation, Ability to change internal work processes, IT workforce, funding, citizen participation in design, portal strategies and policies, leadership, marketing and governance as factors for e-government adoption. Chen et.al [39] uses UTAUT model to study on the factors affecting e-government adoption and found that performance expectancy, effort expectancy, social influence, and facilitating conditions impact citizen satisfaction. Rokhman [40] Conducted citizen’s willingness to accept and adopt e-government services and found that relative advantage and compatibility proven as useful factors to predict intention to use e-government services. Gilbert and Balestrini [41] bring attitude-based and service-quality-based approaches together. They propose perceived (confidentiality, ease of use, safety, reliability, visual appeal and enjoyment) and perceived relative benefits as the adoption factors for e-government. Phang et.al., [25] made a study on senior citizen’s adoption of e-government and they found that compatibility, personal image, perceived ease of use and internet safety perceptions are the main factors for e-government adoption. Table 3 shows brief classification of the adoption factors. These adoption factors of e-government were not classified properly in previous literatures. This study demarcates the adoption factors as technological, financial, website quality, user/human, managerial and political perspectives as described in table 3.

The successful adoption of e-government can be achieved by developing a set of e-government competencies/adoption factors and investigating the significant relationships of those factors on its performance. The support from the top management for the implementation of e-government process is an important factor.

**Figure 1: E-government adoption: A Conceptual Competency Framework**

The IT manager must consider all the newly developed technologies and should choose the best one which is more flexible and suitable to particular system. But using a modern system which is more expensive must be given a second thought; i.e., if the system gives much improved efficiency and helps to cut cost in other way, then it should be considered, because adoption of e-government aims at decrease in coordination cost too. As far as citizens are concerned, they play a major role in e-government success. Hence when an e-government project is implemented it should take care of the factors influencing the end user’s willingness to use that particular system. Attainment of trust of the end user is important and also risk and security related problems should be considered and eliminated. Also the language of the website is important; local language should be preferred when it is to be used by the common man. Integration of the back office is another concern for success. If there is no integration then it will lead to overloading of the users and hence multiple collection of same information by different departments which is a wastage of efficiency and time of public services. Figure 1 is the conceptual framework for e-government adoption which shows the major competences to achieve the best E-government performance.

**5. DISCUSSIONS: E-GOVERNMENT CHALLENGES**

Implementation of e-government projects can cause number of challenges as it is the redefining of complete government processes. There are a number of impediments that potentially block e-Government adoption. Barriers can be any factors that cause hindrance to government in developing new or further improving the existing e-government applications. Initial use of e-government Web sites is an important indicator of e-government success. Some information system research indicated that its eventual success depends on its continued use rather than first-time use [17, 28, 29]. However, the desired outcome is not achieved unless a significant number of citizens move beyond the initial adoption and use e-government web sites on a persistent basis.
According to case studies from different countries, there are many challenges and issues that need to be addressed for successful implementation of e-government. There are distinct factors that command the adoption of e-government, and these factors depend on the local context of any country. But there is no clear classification of these adoption factors. Warkentin et al [36] describes e-government adoption as the citizen intention to participate in government activity electronically to receive information and request services from the government. According to Carter and Belanger [42] it is intent to use, while Gilbert and Balestrini [41] measure it as willingness to use e-Government services. Altogether it can be stated as a simple decision to use, or not to use, e-government services. The next level of challenge of e-government is to make it frequently used by the citizen. Using e-government service once in a year would not be considered as a meaningful usage of its application. Citizens technical awareness – on how to adapt to frequent technical changes in the services – is another very important challenge of adoption. The successful adoption of e-government can be achieved by developing a set of e-government competencies/adoption factors and investigating the significant relationships of those factors on its performance.

6. CONCLUSION

Advances in ICTs are giving organizations a new competitive edge. Growing impact of ICT, surge in the usage and adoption of E-government services. The globalization of organizations facilitated by the advent of telecommunications and internet technologies has promoted adoption of E-government. The best practices of E-government are revolutionizing not just technology itself but the whole process through which services are provided. This study helps better understand E-government and identifies various competence factors like technological, managerial, political, user and website quality for E-government adoption. This study presented a conceptual framework which can be empirically tested to understand and measure the E-government performance. This study would provide researchers to do an empirical examination on the identified factors of E-government with its performance. This study would also help managers decide to what extent their organizations should invest in E-government by matching the E-government attributes to their own organization’s characteristics. Our investigation of E-government adoption factors may help both researcher and potential adopters.
